

DECLARATION

We hereby declare that we have used Artificial Intelligence (AI) tools in the preparation of this assignment. We understand that while AI can assist in generating ideas, providing information, and suggesting edits, it is our responsibility to critically evaluate the accuracy and relevance of the content generated by AI. Below, we provide specific details of how AI tools were used in our assignment:

Type of AI used	Purpose of using the AI	Description of AI contribution* (Detail the extent to which AI contributed to the assignment, including specific sections or tasks where AI was used)	Member's contribution (Describe your own input and how you integrated AI-generated content into your work)
Generative AI (Gemini)	Assist in the creation of the Interactive Models.	• Explain the syntax for the 2D CRT Model from a public GitHub repository. • Assist in plotting the coordinates in the website.	• Adjusted the numerical values of the 2D CRT Model to improve its structure. • Created and edited the necessary css elements to fit our own group's visual. • Adjusted the other css elements to improve the model's visual and animation. • Copied the code from a group member for the dynamic changing of content/text.

Generative AI OpenCode Big Pickle	First time using mdx, react three fiber, astro, and the entire tech stack for this project.	• Asked AI what components should I be importing from my tech stack in order to perform my stated feature. • Acted as a code debugger looking at my implementation for reasons why my css implementation was not working or why my 3d model was crashing from my implementation. • Requested it to show how to implement some of the boilerplate code needed to make the 3d model work.	• Adjusting the hardcoded numerical values 3d model canvas. • Made the implementation for the timeline component as well as wrote the necessary css file to set up the look of the timeline. • Under guidance from AI, we wrote some of the logic in the lcd model needed to make it work. • Copying the styling made by a different group member, setup the frontend wiring and states needed to have the frontend accept user interactions for the LCD page. • Wrote the content alone for the LCD structure and implemented their dynamic changing on the frontend. • Came up with the idea of dynamically changing text descriptions on the frontend and decided how the user interaction is supposed to go.
